C; Comment: This inhibitory fragment, released from native ITI after limited proteolys first domain interacts weakly with PMN-granulocytic elastase and not at all with panc C; Comment: The amino acid at position of (19-Met) appears to determine the specificit delastase; those with leucine interact strongly.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 July transfer protein EP2 precursor - carrot

N.Alternate names: extracellular protein 2

C.Species: Daucus carota (carrot)

C.Scerk, P. 3, 907-921, 1991

R.Sterk, P. 3, 907-921, 1991

A.Title: Cell-specific expression of the carrot EP2 lipid transfer protein gene.

A.Reference number: J01280; MUID:92361243

A.Residues: 1-120 expression: GB.M64746; NID:9167553; PIDN:AAB96834.1; PID:9167554

A.Ccoss-references: GB.M64746; NID:9167553; PIDN:AAB96834.1; PID:9167554

C.Comment: This protein locates in cell walls.

C.Comment: This protein locates in cell walls.

C.Comment: The gene encoding for this protein is expressed in the embryogenic cell culture supersymally: phospholipid transfer protein

C.Superfamily: phospholipid transfer protein

F:1-26/Domain: signal sequence #status predicted <LIP>
F:27-120/Product: lipid transfer protein EP2 #status predicted <LIP>

TIHOBI
alpha-licroglobulin/inter-alpha-trypsin inhibitor - horse (fragment)
N.Alternate names: E1-14 (inhibitory fragment of III); III; trypsin inhibitor, E-UTI
C.Species: Equus caballus (domestic horse)

Title: Perfect score: Sequence:

US-09-441-654A-1 170 1 ADRERSIHDFCLVSKVVGRC......ACMLRCFRQQENPPLFLGSK 170

OLIGO Gapop 60.0 , Gapext 60.0 Scoring table:

88757 seqs, 32294092 residues

d size : arched:

Total number of hits satisfying chosen parameters:

88757

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Listing first 45 summaries

SwissProt_39:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CLADINION: THE COATOMER IS A CTTOSOLIC PROTEIN COMPLEX THAT BINDS

C. !- FUNCTION: THE COATOMER IS A SOCIATES WITH GOLGI NON-
CC CLATHRIN-COATOM THE EN, VIA THE GOLGI UP TO THE TRANS

CC CLATHRIN TRANSPORT FROM THE ER, VIA THE GOLGI UP TO THE TRANS

CC NETWORK. COATOMER COMPLEX IS REQUIRED FOR BUDDING FROM GOLGI

NETWORK. COATOMER COMPLEX THAT CONSISTS OF AT LEAST THE ALPHA,

BETA, BETA, GAMMA, DELTA, EPSILON AND ZETA SUBUNITS.

C. SUBCELLULAR LOCATION: THE COATOMER IS CATOPLASMIC OR POLYMERIZED

ON THE CYTOPLASMIC SIDE OF THE GOLGI. AS WELL AS ON THE

VESICLES/BUDS ORIGINATING FROM IT (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the European Bioinformatics Institute. LIMITED PROTEOLYSIS WITH TRYPEIN, CONTAINS TWO HOMOLOGOUS DOMAINS. WHEREAS THE SECOND DOMAIN IS A STRONG INHIBITOR OF TRYPSIN, THE FIRST DOMAIN INTERACTS WEAKLY WITH PMN-GRAUDICCTIC ELASTASE AND NOT AT ALL WITH PANCREATIC ELASTASE.

-!- MISCELLANBOUS: THE AMINO ACID AT POSITION P2' (17) APPEARS TO DETERMINE THE SPECIFICITY OF THE INHIBITION OF DOMAIN I.

INHIBITORS WITH METHONINE IN THIS POSITION INTERACT STRONGLY.

-!- SHMILARTY: BELONGS TO THE BPTI/KUNITZ FAMILY OF INHIBITORS.

-!- SHMILARTY: BALONG.

A Uji T., Kobayashi N., Kohsaka T.;

A novel C3 allotype C3'F02'has an amino acid substitution that may inhibit 103b synthesis and cause C3-hypocomplementemia.";

Inhibit 103b synthesis and cause C3-hypocomplementemia.";

Mol. Immunol. 30:62-62/1993).

-!- FUNCTION: C3 PLAYS A CENTRAL ROLE IN THE ACTIVATION OF THE COMPLEMENT SYSTEM. ITS PROCESSING BY C3 CONVERTASE IS THE CENTRAL COMPLEMENT PATHAPYS.

REACTION IN BOTH CLASSICAL AND ALTERNATIVE COMPLEMENT PATHAPYS.

AFTER ACTIVATION C3B CAN BIND COMPLEMENT WING AGGREGAISS.

-!- FUNCTION: DELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGAIS.

-!- FUNCTION: DELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGAIS.

-!- FUNCTION: DELL SURFACE CARBOHYDRATES OR IMMUNE CARBOHYDRATES OR AGREATING C3B (BETA CHAIN, ALPHA).

--- FUNCTION: DELL SURFACE CARBOHYDRATES OR CHAIN, ALPHAN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -1- MISCELLANEOUS: IC3B IS THE SLOWLY CLEAVED (POSSIBLY BY FACTOR I)

Ilpoprotein receptor gene family, 9p330 and LRP/alpa ZMR, and the
Teceptor-associated protein (RAP) ";
J. Histochem Cytochem. 42:331-54(1994).
TEVINCTION: BINDS PLASMINGEN ACTIVATOR INHIBITIOR TYPE I
COMPLEX, APOLIPOPROFEIN E-ENRICHED BETA-VLDL, LIPOPROFEIN LIPASE,
LACTOFERRIN, GLUSTERIN AND CALCIUM.
TEVINCTION: RECEPTOR-MEDIAFED UPTAKE DE POLYBASIC DRUGS SUCH AS
APROTININ, AMINGLYCOSIDES AND POLYMYZIN B.
TEVENTION: RECEPTOR-MEDIAFED UPTAKE DE POLYMESED IN
CIPATRIN-COATED PITS; A SOLUBLE FORM IS POSSIBLY BERIVED BY
CIPATRIN-COATED PITS; A SOLUBLE FORM IS POSSIBLY DERIVED BY
CLEAVAGE AT THE CELL SURRACE.
TISSUE SPECIFICITY: EPITHELIAL CELLS OF KIDNEY GLOMERRULUS AND
PROXIMAL TROUBLE, LUNG, PEPIDAMAS, CANOG OTHERS.
THISMLARITY: CONTAINS 35 LDL-RECEPTOR CLASS A DOMAINS.
TOWNILARITY: CONTAINS 37 LDL-RECEPTOR CLASS B DOMAINS.
TOWNILARITY: CONTAINS 3 S12-BINDING DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 3. Application US/08974196
Patent No. 5854396
Patent No. 5854396
GENERAL INFORMATION:
APPLICANT: SHIMOMURA, Takeshi
APPLICANT: KAWAGUCHI, Toshiya
APPLICANT: KAWAGUCHI, Toshiya
APPLICANT: MOVEL PROTEIN, DNA CODING FOR SAME
TITLE OF INVENTION: AND METHOD OF PRODUCING THE PROTEIN
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
ADDRESSEE: SUGHRUE, MION, ZINN, MACPEAK & SEAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 26;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Indels

                                                                                                  inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal cord

codema, inflammation, infection or granulomatosis, multiple

sclerosis, ischaemia, perioperative blood loss, sepsis, shock,

fibrosis, blood coagulation diseases, polytrauma, stroke,

carboral or subarachnoid haemorrhage and gastric or cervical

cancer and prevent metastasis. It is particularly useful for

reducing blood loss during surgery, and can also be used to treat

other cancer, arthritis, anaemia, non-insulin dependent diabetes,

influenza and similar viral infections, acute pancreatitis and

aprotinin, but is less highly charged so should be less

immunogenic and less likely to damage the kidneys. Manipulation

of the bikunin sequence may allow the inhibitory profile to be

allood or blood products during surgery, thereby reducing the risk

of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 CATVIENAIGDLAISRNAADSSVPSAPRRQDSEDHSSDMFNYEEYCIANAVIGPCRASFP 120

inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal cord
cedema, inflammation, infection or granulomatosis, multiple
sclerosis, ischaemia, perioperative blood loss, sepsis, shock,
fibrosis, blood coagulation diseases, polytrama, stroke,
cerebral or subarachhoid hemorrhage and gastric or cervical
cancer and prevent metastasis. It is particularly useful for
reducing blood loss during surgery, and can also be used to treat
other cancer, arthritis, anaemia, non-insulin dependent diabetes,
influenza and similar viral infections, acute pancreatitis and
gout, and prevent pre-term labour. It has similar properties to
aprotinin, but is less highly charged so should be less
immunogenic and less likely to damage the kidneys. Manipulation
of the bikunin sequence may allow the inhibitory profile to be
allood or blood products during surgery, thereby reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 ADRERSIHDFCLVSKVVGRCRASMPRWWYNVTDGSCQLFVYGGCDGNSNNYLTKEECLKK 63

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal carrio cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, stock ilprosis, blood coaquidation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and other cancer, error labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
    plasmin; factor XIIa; treatment; prevention; oedema; inflammation; infection; granulomatosis; multiple sclerosis; ischaemia; perioperative blood loss; sepsis; shock; fibrosis; blood coagulation disease; polytrauma; stroke; haemorrhage; gastric cancer; cervical cancer; metastasis; blood loss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedend, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytramma, stroke, cerebral or subarachnoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk the content of th

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrama, stroke, cerebral or subarachnoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss

```
The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arithrits, anaemia, non-insulin dependent diabetes, influenca and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss

cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treconther cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less and the bitmin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                ö
                     The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, if brosis, blood coequilation diseases, polytramma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cher cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and other amorphism of similar viral infections, acute pancreatitis and aprovent pre-term labour. It has similar properties to aprotinin, but is less highly to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys. Manipulation cof the bikunin sequence may allow the inhibitory profile to be altered it also reduces or eliminates the need for whole donor blood or blood broducts during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

inhibits, e.g. trypic is a numen paracrat control.

Inhibits, e.g. trypic is a numen paracrat control bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebrai or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to exprotinin, but is less highly to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered it also reduces or eliminates the need for whole donor blood or blood dother adverse side effects, as well as reducing

The sequence was deduced from a CDNA clone (T61439) obtained from cancer cell into MKN45. Also claimed are isolated peptides (W13662-64) of HAI-II, the DNA encoding HAI-II, a vector carrying this DNAA, and a host cell, pref. an animal cell, transformed with the vector. HAI-II can be used for regulating HGF activator activity (and thus HGF activity) in vitro and in vivo. It may also be used for investigating the function of
                                                                                                                                                                                                  Novel protein HAI-II - inhibits protease activity of hepatocyte growth factor activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 170; DB 18; Length 252; 100.0%; Pred. The present sequence represents a human tissue factor pathway inhibitor-3 (TFPI-3) which contains two kunitz type domains. The invention also provides the TFPI-3 cDNA and screening methods for identifying agonists and antagonists of TFPI-3. As TFPI-3 inhibits protease activity, it is claimed to be useful for, e.g. inhibiting intravascular clotting and preventing the formation of fibrin clotts myor, for treating coronary occlusion with active myocardial infarction and in the prophylaxis and treatment of peripheral arterial embolism, for the treatment of sepsis, inflamment of seases and transplant rejection. TFPI-3 is also claimed to be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as an anticoagulant in blood transfusions, extracorporeal circulation, and dialysis procedures and in blood samples for laboratory purposes. The TFPI-3 antagonists are claimed to be useful for promoting coagulation, e.g. in the treatment of haemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                              Isolated tissue factor pathway inhibitor-3 - used to develop products for treating, e.g. pulmonary embolism, thrombosis, sepsis, inflammatory disease, transplant rejection or haemophilia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28 adrersihdfclvskvvgrcrasmprwwynvtdgscqlfvyggcdgnsnnyltkeecis

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, ifbrosis, blood coaquilation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and other cancer, arthritis, namemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and spout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing Sequence

New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss

Claim 1; Page 67; 110pp; English.

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coaquilation diseases, polytramm, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and optical and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk the carriary.

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, multiple colema, inflammation, perioperative blood loss, sepsis, shock, increarly or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and influenza and inflammation in the similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys. Manipulation influence may allow the inhibitory profile to be altered it also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss
                                                                                                                                                                                    Human; placental bikunin; inhibition; trypsin; kallikrein; plasmin; factor XIIa; treatment; prevention; oedema; inflammation; infection; granulomatosis; multiple sclerosis; ischemaia; perioperative blood loss; sepsis; shock; fibrosis; blood coagulation disease; polytrauma; stroke; haemorrhage; gastric cancer; cervical cancer; metastasis; blood loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Page 67; 110pp; English.

The present sequence is the EST R74593 protein, which is similar to human bikunin. Bikunin inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.
Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple sclerosis, ischäemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or plasmin; factor XIIa; treatment; prevention; oedema; inflammation; infection; granulomatosis; multiple sciencis; ischemnia; perioperative blood loss; sepsis; shock; fibrosis: blood coagulation disease; polytrauma; stroke; haemorrhage; gastric cancer; cervical cancer; metastasis; blood loss; Muller DK, Tamburini PP; consensus bikunin; inhibition; trypsin; kallikrein; TGA" GAN" TGA" TGA" 'note= "encoded by TAA" 'note= "encoded by TGA" Location/Qualifiers ρλ 'note= "encoded by "encoded by Marlor CW, Disclosure, Fig. 2; 110pp; English. /note= "encoded 'note= "encoded 96US-0725251. 96US-0013106. 96US-0019793. ```
gout, and prevent pre-term labour. It has similar properties to aprofinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk the cost of surgery.
